

OSTATI HIDRO®

LAFARGE Technical partner of

Information about product:

Slag Portland cement **OSTATI HYDRO CEM III/A 42,5 N** is a special cement of 42,5 strength class having a low hydration temperature. Granulated slag is used as an additive.

Product use:

- Production of slow set durable concrete of high final strength (B25 class and higher)
- Arrangement of heavy foundations
- Construction of underground structures
- Construction of marine and coast-protecting constructions
- Construction of hydraulic constructions and hydropower plants

Product advantages:

- Neutralization of silica-alkali reaction due to the low content of alkali
- Resistance to sulfate intrusion
- Reduction of cracking risk
- Water-proof in wet conditions
- Development of high final strength that continues after 28 days
- Low hydration temperature
- Increased strength of construction
